## Strategy Highlights

- Proprietary Index Tracking:** The WSTCM Sector Select Risk-Managed Fund seeks to deliver the returns of the WSTCM Sector Select Risk-Managed Index, a public index published by Bloomberg and calculated by Standard & Poor's Custom Indices. The Fund and the Index use the same quantitative investment model developed by WSTCM to make investment decisions.
- Tactical Sector Rotation and Risk Overlay:** The Strategy employs WSTCM's proprietary industry momentum model and advanced multi factor technical trading strategies to select attractive sectors of the S&P 500® Index while utilizing alternative asset classes to minimize portfolio volatility and drawdowns.
- Portfolio Structure:** The Fund is comprised of the "Sector Segment" made up of any combination of the various primary sectors of the S&P 500® Index and the "Alternate Segment" composed of investment grade fixed income securities and one gold related security.
- Primary Asset Allocation:** Under normal market conditions, the Strategy will invest 80% of the value of its assets in the Sector Segment overweighting the most favored sector.
- Capital Appreciation with a Preservation Focus:** The quantitative rules based investment model may rotate out of the Sector Segment and invest 100% of the portfolio in Alternate Segment in an attempt to insulate capital from external market forces.

## Performance

## Disclosures

**This material must be preceded or accompanied by a prospectus. An investor should consider the fund's investment objectives, risks, and charges and expenses carefully before investing or sending money. This and other important information about the Fund can be found in the fund's prospectus. To obtain more information, please call 1-866-515-4626. Please read the prospectus carefully before investing. WSTCM Funds are distributed by Foreside Fund Services LLC.**

Prior to December 31, 2016 the WSTCM Sector Select Risk-Managed Fund was known as the WST Asset Manager – U.S. Equity Fund.

An investment in the Fund is subject to investment and market risk. There can be no assurance that the Fund will be successful in meeting its investment objective. The Fund's investments are selected primarily by a proprietary investment model developed by the investment adviser, Wilbanks, Smith & Thomas. There can be no assurance that the use of the investment model will enable the Fund to achieve positive returns or outperform the market.

The Fund intends to invest in ETFs and other pooled investments that subject the Fund to paying its proportionate share of fees and expenses from those investments. Investments in precious metals, like gold, subject the Fund to production and price volatility risks. ETFs may trade at a premium or discount to its underlying net asset value. The Fund's investment in fixed income securities subject it to credit risk, interest rate risk, and maturity risk. All these risks, among others, could affect the value of investments of the Fund, possibly causing the Fund's share price and total return to be reduced and fluctuate more than other types of investments. The Fund may not be able to track the performance of the WSTE Index due to differences in operating expenses and investment timing.

The Fund will be subject to sector risk when it invests a significant portion of its assets in securities representing one or more sectors. Commodities and futures generally are volatile and are not suitable for all investors. The fund is non-diversified and as a result is subject to a greater risk of loss if an individual investment performs poorly. The value of commodity funds relate directly to the value of the futures contracts and other assets held within the fund and any fluctuation in the value of these assets could adversely affect an investment in commodities.

Comparison with a Market Index – The S&P 500 index is comprised of large capitalized companies across many sectors and is generally regarded as representative of US stock market and is provided in this presentation in that regard only. You cannot invest directly in an index such as these and the performance of an index does not represent the performance of any specific investment.

Comparison with a Secondary Market Index – The S&P 500 Trend Allocator index is designed to track the performance of a systematic trend-dependent strategy allocating between the S&P 500 and cash, based on price trends. If the S&P 500 is observed to be in a positive trend, then the index is allocated to the S&P 500, otherwise, it is allocated to cash. You cannot invest directly in an index such as these and the performance of an index does not represent the performance of any specific investment.

Yield to maturity: Average anticipated rate of return for the portfolio's positions if held to maturity.

Beta is a measure of systematic risk, or the sensitivity of a manager to movements in the benchmark. A beta of 1 implies that you can expect the movement of a manager's return series to match that of the benchmark used to measure beta. Standard deviation of return measures the average deviations of a return series from its mean, and is often used as a measure of risk. A large standard deviation implies that there have been large swings in the return series of the manager.
